APPLICATION AND CLEANUP

EQUIPMENT SETUP NOTES:

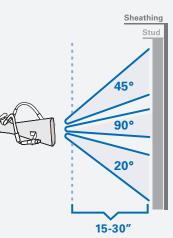

- 1. Set up blowing machine to achieve 1.5 to 1.6 psi *orifice* pressure (at the end of the blow hose) with no material flowing (2.0 to 2.5 psi for overhead application).
- 2. Set up material feed rate to achieve approximately 20 lbs/min of Spider Plus.
- 3. Make sure water spray tips are clean and undamaged.
- 4. Set up water pump to run at 1000 psi at the gauge in the fluid delivery system.
- 5. Check water flow rate at nozzles to ensure approximately 2.2 lbs/min and a wide mist spray pattern (65° wide mist).
- 6. Record setup parameters to speed up future setup process.

WALLS

Spraying:

Using a high density nozzle (HDN), spray at a distance of 15-30 inches (closer for higher density, further for lower density).

When turning spray nozzle on and off, the water spray should be the first on and the last off. If needed, move nozzle closer at the top and bottom of cavity to avoid low density in these areas.

Scrubbing:

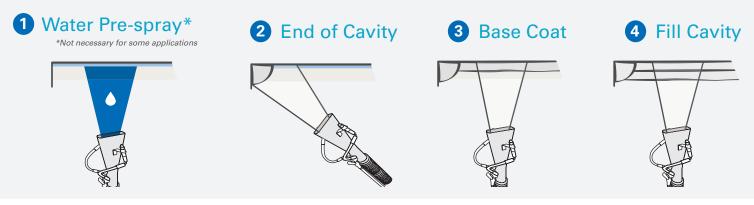

Scrub the face of the cavities to remove excess material. Vacuum flyoff and excess material into refeed system. Maintain a sufficient quantity of new material in the hopper to avoid spraying with only refeed.

A 3-person crew is recommended to keep up with spraying, scrubbing and vacuuming to ensure minimal fluctuation in refeed rate.

OVERHEAD

Establish a foundation in the end of a cavity, then fill the cavity in layers

JOBSITE CLEANUP:

- Remove masking
- Clean the details (material is easily removed by hand or broom)
- Sweep the floor (don't vacuum dirt & debris with refeed system)
- Properly secure equipment in truck
- Store fluid delivery system in a location that will avoid freezing
